

Secure Your Communication With enhanced Web Services Technology

A major drawback of current web services is their lack of security features. Notably mutual secure authentication of web service user and web service provider is seldom available.

Our approach to overcome this disadvantage is simple: We propose to enhance existing Web Services technologies and their infrastructure with encryption and digital signatures. These **enhanced Web Services (eWS)** provide authentication by using XMLSignature and secure the privacy of your valuable data by encrypting it with XML-Encryption. **eWS** is a powerful extension to protect your privacy and to provide you as a web service provider and your customers with information about the authenticity of each other using X.509 certificates.

A working implementation of **enhanced Web Services Technology** is already available.
